

## UGANDA TRAFFIC DATA TRAINING

Sky High have recently undertaken their first contract on the continent of Africa. Appointed by UK based engineering consultancy Roughton International, Sky High have provided the Ugandan National Roads Authority with consultancy advice and the delivery of road traffic flow monitoring equipment with associated training. The project involved the delivery of a one week on-site training course, demonstration project, field tests and support services based in the capital city Kampala. The project has provided UNRA with local staff equipped, trained and competent in carrying out traffic flow surveys as part of the Ugandan Government's national road maintenance and development strategy.

"Sky High undertook the training in Uganda and delivered the project to the NRA. It was an exciting, challenging and rewarding project for us to undertake and the very positive feedback received from our clients gives us confidence that Sky High will reap long-term benefits from future commissions in the rapidly developing East African market."
